

CREATE YOUR CUSTOMISED AGROFORESTRY PROJECT

WHY INTEGRATE AGROFORESTRY INTO YOUR VALUE CHAIN?

In tropical or temperate zones, planting trees on agricultural land that produces raw materials enables you to contribute to the preservation of natural ecosystems and their biodiversity.

- **On a local scale**, trees planted on agricultural land create a micro-climate and help protect crops from wind, drought, extreme cold and natural hazards such as storms and floods. Our solution for creating customised agroforestry projects thus enables you to participate in securing your supply chains by helping to adapt them and make them more resistant to hazards and climate change.
- **On a global scale**, trees store carbon and contribute to the fight against climate change. It has been demonstrated that moving from conventional agriculture to agroforestry allows up to 40% more carbon to be stored in the soil.

WHAT IS AGROFORESTRY?

Agroforestry is the practice of integrating trees and shrubs into agricultural plots to improve soil quality, limit soil erosion and develop biodiversity, while making agriculture more sustainable and respectful of ecosystems.

In tropical zones, this system also makes it possible to diversify harvested products and improve farmers' social, economic and environmental conditions.

BENEFITS FOR THE COMPANY AND THE ENVIRONMENT

REGENERATES
ECOSYSTEMS

PRESERVES
BIODIVERSITY

SECURES RAW
MATERIAL CHAINS

HELPS FIGHT
CLIMATE CHANGE

PROVIDES SOCIAL
AND ECONOMIC
ADVANTAGES

HOW DOES IT ACTUALLY WORK?

INTEGRATE TREES INTO YOUR COMPANY'S AGRICULTURAL PLOTS

Your company has privately owned agricultural land that supplies it with raw materials.

We plant trees or create hedgerows on your plots.

Your crops benefit the nutritional input, protective cover and environmental advantages provided by trees. The agroforestry system generates multiple benefits for the natural local ecosystem and helps to develop biodiversity.

CREATE AN AGROFORESTRY SYSTEM AT THE HEART OF YOUR CHAIN

Your company depends on a supply chain for its raw materials.

We create an agroforestry project within your supply chain, or you finance an existing project within which you can source your supplies and develop a more sustainable chain.

You improve the environmental impact of your value chain and help secure your supply chain by taking into account the impact that climate change has on it.

REFOREST'ACTION SUPPORT

Reforest'Action handles the preliminary study, technical engineering, field planting and upkeep of the agroforestry system created in collaboration with its technical partners.

A reasoned and pragmatic approach, **directly linked to the realities of the terrain as well as agricultural systems.**

PRELIMINARY STUDY

Reforest'Action studies your needs and the characteristics of your supply chain or private plots.

IMPLEMENTATION

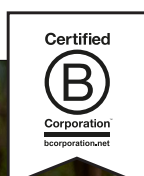

With our technical partners' support, we create a customised agroforestry system that is fully integrated into your value chain.

MONITORING

The planted trees are monitored for five years after their installation on site.
